DECEMBER 8, 2014

10:00 A.M.

MS. RAITT: Good morning. So welcome to today's IEPR workshop on the California energy demand updated forecast for 2015 through 2025. I'm Heather Raitt, I'm the project manager for the IEPR.

I'll begin by going over the usual housekeeping items.

Bathrooms are in the atrium. There's a snack bar on the second floor.

If there's an emergency and we need to evacuate the building, please follow staff to Roosevelt Park, which is across the street diagonal to the building.

Today's workshop is being broadcast through our WebEx conferencing system. Parties should be aware they're being recorded. We'll post an audio recording on the Energy Commission's website in a couple of days and a written transcript in about a month.

This morning we're going to have opening comments from Commissioners and then Chris Kavalec from the Energy Commission staff will give a presentation on the forecasts. Then we'll break for lunch and come back and hear from the utility representatives for their comments on the forecasts. Then we'll go into public

1 comments.

2 We're asking parties to limit their comments
3 to three minutes. During the public comment period,
4 we'll take comments first from those in the room, then
5 anybody participating by WebEx who'd like to comment,
6 and then those who are phone-in only.

7 If you'd like to make comments during the
8 public comment period, please come to the center podium
9 and give your business card to the court reporter.

10 Materials for the meeting are available on
11 the table at the entrance to the hearing room. And we
12 welcome written comments. They're due on December 17th
13 and the workshop notice provides the information about
14 how to submit the written comments.

15 And with that, I'll give it to Commissioner
16 Scott. Thank you.

17 COMMISSIONER SCOTT: Thank you, Heather, and
18 good morning, everybody. I will not repeat all of the
19 things that Heather said but I just want to welcome
20 everyone to our workshop on the updated electricity
21 forecast, and probably turn it right over to Chris
22 unless Commissioner Douglas? All right, right to Chris.

23 MR. KAVALEC: Good morning. I'm Chris Kavalec
24 from the Demand Analysis Office, and today I will be
25 presenting our California energy demand updated

1 forecast for 2015 to 2025, or CEDU 2014 as we call it.

2 But before I get started, I wanted to mention
3 the passing of Bob Weatherwax earlier this year. He was
4 one of our first chief forecasters way back in the late
5 70s and he was instrumental in developing our
6 forecasting capability and pioneering our first end use
7 models, and he set a standard for quality that we try
8 to live up to since then. And he handed the mantle or
9 the reins over to Mike Jasky and went on to a lucrative
10 consulting career including work he did for the Energy
11 Commission. So Bob, we'll miss you.

12 Okay, my presentation today, I'll be talking
13 about how we did the forecast, the method, the critical
14 economic and demographic assumptions that went into his
15 forecast update; statewide and planning area baseline
16 results.

17 In our forecast we distinguish now between a
18 baseline forecast which includes efficiency from
19 initiatives that have already been approved and funded.
20 For example, a standard that has been implemented goes
21 into the baseline forecast. The 2013/14 IOU efficiency
22 programs go into the baseline forecast since they've
23 already been approved and funded.

24 There are also additional efficiency
25 potential savings that we project and we call those

1 additional achievable energy efficiency, or AAEE. So
2 those include efficiency from initiatives that aren't
3 yet on the books but are reasonably likely to occur.

4 For example, IOU efficiency programs for 2016
5 and beyond, or the next update for the 2016 for Title
6 24 standards, those would be part of AAEE.

7 And combining the two forecasts, baseline
8 with AAEE, gives us what we call a managed forecast
9 that's used for resource planning purposes.

10 Okay, CEDU 2014. The main reason we're doing
11 this is to provide an update for the California ISO's
12 transmission planning process, or TPP, which is a
13 proceeding that happens every year, as well as the
14 CPUC's long term procurement planning process, or LTPP.
15 That's on a two-year cycle; however, in the second year
16 of that process they would like to have an update to
17 the demand forecast.

18 And this forecast is meant to account for
19 more recent projections for economic and demographic
20 growth. At the same time, we're updating the historical
21 data for consumption and sales from our QFER data
22 filings from the utilities. Distributed generation. We
23 have updated data for 2013 adoptions for (inaudible)
24 and other technologies as well as pending adoptions in
25 2013 and 2014, as well as peak demand from this last

1 summer.

2 We're not updating the forecast for other
3 factors that go into the forecast. For example,
4 efficiency distributed generation, aside from updating
5 the historical data. Electrification, including EVs or
6 climate change, those aren't -- those forecasts aren't
7 being updated except to rescale as necessary.

8 For example, with electric vehicles, our
9 updated consumption and peak data will have any load
10 impacts from EVs already embedded. So therefore, we
11 have to transform our electric vehicle forecast so that
12 it is incremental to the last historical year.

13 One thing about demand response. In the
14 version of the forecast that's posted, we didn't update
15 the demand response numbers for demand side impacts, or
16 the demand side version of demand response.

17 A couple of the utilities have requested that
18 we update the demand response using the April 2014
19 filings by the IOUs. So I think between now and when
20 the forecast is adopted, we can update the demand
21 response. It'll have a miniscule effect on the
22 forecast; however, demand response is receiving a lot
23 of attention so we thought it might be prudent to
24 update those numbers unless there is some objection
25 from the Commissioners.

1 Okay. A few slides on how we did this
2 forecast.

3 We wanted and needed to do this forecast
4 fairly quickly, so rather than use our full end use
5 models, we used our simpler econometric single equation
6 models. We updated these models, we reestimated these
7 models with the latest historical data. And we have
8 models for all the major economic sectors as listed
9 here, plus one for peak demand.

10 As an example, in our econometric model for
11 residential electricity consumption, we have
12 electricity consumption as a function of per capita
13 income, persons per household, cooling and heating
14 degree days, residential electricity rates, etcetera.

15 Another example. For peak demand we also have
16 economic factors, plus we have annual maximum average
17 daily temperature as a variable. The reason I mention
18 that is because that maximum temperature along with
19 cooling and heating degree days, they change over the
20 forecast period because climate change impacts are
21 incorporated, brought to us through scenarios developed
22 by the Scripps Institute of Oceanography.

23 Okay. So we now have our updated econometric
24 models and we run the models first with the economic
25 and demographic projections that we used in our

1 previous forecast for the 2013 IEPR, and those
2 projections come from Moody's and Global Insight along
3 with the Department of Finance from July of 2013.

4 Then we run these econometric models with
5 newer economic and demographic data from August of this
6 year. We have to go out an additional year. We want the
7 forecast going out to 2025, so we had to make
8 assumptions for rate growth and climate change impacts
9 out one more year.

10 So what we did was we assumed rate growth of
11 one percent from 2024 to 2025. Seemed pretty
12 reasonable. And we extrapolated our climate change
13 impacts; in other words, the impacts of climate change
14 on our temperatures, out one year to 2025.

15 So we now have two sets of econometric
16 results. We looked at the percentage differences
17 between the two, the newer versus the older, and we
18 apply these percentage differences to our 2013
19 forecast.

20 Net of what we call post process impacts. And
21 what I mean by that is when we do a full forecast we
22 run our sector models, but there are some factors that
23 impact electricity demand that aren't captured in our
24 models. For example, demand response, electric
25 vehicles, efficiency from utility programs, etcetera.

1 Those are post process, so the sector results are
2 adjusted for these factors.

3 Now, these factors aren't changing with the
4 exception of demand response, as I mentioned earlier,
5 so we net these out, then we apply the percentage
6 differences from the two econometric model runs.

7 Before we reapply these post process impacts
8 to the adjusted forecast, we need to develop one more
9 year for each of these effects.

10 So for committed efficiency or efficiency
11 from programs that are already in place, we used our
12 decay function, our exponential decay function, to
13 estimate the remaining savings out one more year from
14 these programs.

15 For high speed rail, which is part of our
16 electrification, we had numbers for 2025 from the
17 latest high speed rail authority plan.

18 Demand response as it sits now, for 2025 we
19 assumed the same as 2024.

20 And for electric vehicles and other
21 electrification including the ports, we did a simple
22 extrapolation out one year.

23 So now we're ready to apply our rescaled post
24 process impacts to the adjusted forecast to give us
25 electricity consumption forecasts for each planning

1 area. We forecast for eight different planning areas.
2 For example, Edison is a planning area. PG&E is a
3 planning area. And initial peak forecasts. And I say
4 initial because we still have to go through the process
5 of weather normalization, which I'll talk about more in
6 a minute.

7 To get to electricity sales, we need to
8 subtract off our projected distributed generation,
9 which as I mentioned before, is updated with 2013
10 adoptions and pending adoptions of DG technologies.

11 As I said, we need to develop weather
12 normalized peaks for 2014 to serve as a starting point
13 for the peak forecasts. And what I mean by weather
14 normalized peak, it's our estimate of what peak demand
15 would be in a given planning area, assuming "average"
16 temperatures in that year.

17 The reason we do this is that our forecast,
18 aside from climate change impacts, assumes average
19 weather out into the future because nobody can predict
20 the weather precisely out more than a few days.

21 So to be consistent with our forecast which
22 assumes average weather, we need a starting point to
23 assume average weather, so that's why we weather
24 normalize our peaks for 2014.

25 And as usual, we provide more disaggregate

1 results for individual load serving entities in our
2 1.1C demand form that's posted with our report. And
3 sales, that should actually say net energy for load
4 instead of sales. Net energy for load means you're
5 adding in losses, transmission and distribution losses.
6 So net energy for load and peak demand for what we call
7 local areas.

8 For example, PG&E in the Bay Area only is a
9 local area. Southern California Edison load in the L.A.
10 basin is considered a local area.

11 So we provide these 1.5 forms and these are
12 typically the ones that are used for the planning
13 analyses by Cal-ISO and CPUC.

14 Okay. Our economic and demographic scenarios
15 are consistent with what we used in 2013 since this is
16 an update of the 2013 forecast, and as in 2013, we have
17 a high demand case brought to us by Global Insight,
18 their optimistic scenario. A mid demand case, which
19 comes from Moody's, and it's their baseline case. And a
20 low demand case, which is a combination of two Moody's
21 scenarios, pessimistic and lower long-term growth.

22 The reason we're combining two different
23 scenarios is that using only the pessimistic case, the
24 economic variables reach the same level as the baseline
25 by the end of the forecast period, so we want something

1 that shows both lower growth in the short run and lower
2 growth in the long run, so that's why we combine the
3 two different scenarios.

4 Okay. So what does the new economic and
5 demographic set of projections tell us?

6 In general, the newer projections for
7 critical economic indicators show less growth compared
8 to what we had in 2013, for variables like gross state
9 product, personal income and employment.

10 And this is reflecting more pessimistic
11 national forecasts by both Moody's and Global Insight.
12 What they're telling us is that structural impacts from
13 the recent great recession are higher than had been --
14 or more adverse than had been anticipated previously,
15 so that affects long-term growth.

16 And by structural impacts I'm talking about
17 things like reductions in research and development,
18 less long-term investment, lower growth in worker
19 productivity, less innovation, etcetera.

20 So all these different structural factors go
21 to determine how much long-term investment we're going
22 to have and how much long-term growth we're going to
23 have. Those were affected more adversely by the great
24 recession; therefore, less long-term growth.

25 This is sort of a general school of thought

1 held by a lot of economists around the country and the
2 fed and the congressional budget office agree with this
3 assessment but not everyone does. UCLA, for example, is
4 much more optimistic, at least about California's
5 economic future. But that's a discussion we can get
6 more into when we get into the 2015 IEPR forecast and
7 start talking about what scenarios we want to use
8 there.

9 The one exception to lower growth occurs in
10 the manufacturing sector in the Moody's scenarios, the
11 mid and the low. They have higher manufacturing output
12 growth relative to the forecast in 2013, but this is
13 coming from a change in their model methodology rather
14 than any change in economic expectations.

15 So they made a change. They changed the way
16 that they tie manufacturing output to gross domestic
17 product, and the result was faster growth in
18 manufacturing output.

19 Population projections that we used in the
20 high and mid case are slightly lower than what we had
21 in 2013. Both Moody's and Global Insight tie population
22 growth to economic growth, so if you have less economic
23 growth you're going to have a little bit less
24 population growth. That's the way it works in their
25 models.

1 In the low demand case we're using the
2 Department of Finance population projections, and that
3 hasn't changed since last year, they haven't put out a
4 new official population forecast.

5 Okay. So let's see what some of these
6 indicators look like at the statewide level. I'll
7 mainly be talking about a comparison between the mid
8 demand case from last time versus the new mid demand
9 baseline case, because that's the case that most people
10 care about more.

11 So looking first at personal income, you'll
12 see that the drop-off. Personal income in the 2013
13 forecast, the red line, you'll see it's higher than all
14 three of our new scenarios.

15 Comparing the mid case, by 2024 our new mid
16 case is around 5-1/2 percent lower than our 2013 mid
17 case.

18 Commercial employment did not take as much of
19 a hit. Comparing the two mid cases, the old versus the
20 new, the new one is a little bit less than 1 percent
21 lower in 2024.

22 Manufacturing output, as I mentioned, higher.
23 So you'll see again the red line is from the 2013
24 forecast.

25 So all three of our new scenarios basically

1 are higher than the 2013 mid demand case throughout the
2 forecast period.

3 As usual, Global Insight, the optimistic
4 case, the high demand case, the one in green there.
5 Global Insight assumes -- is much more optimistic about
6 manufacturing growth than is Moody's and it's reflected
7 in their forecast.

8 Statewide population, I didn't include all
9 the cases here since they're all so close together. But
10 the new mid demand case by 2024 is about 0.3 percent
11 lower than it was in the last forecast.

12 Looking at our individual planning areas.
13 Here's I'm showing the largest five planning areas that
14 we forecast for. All of these planning areas took a
15 hit. What this is showing is average annual growth for
16 each of these economic indicators from 2013 to 2024,
17 comparing our 2014 update versus our 2013 forecast.

18 And looking at personal income you'll see
19 that each of these planning areas took a hit in terms
20 of personal income growth. More so in southern
21 California, particularly in the L.A. region for Edison
22 and for LADWP.

23 For commercial employment you'll see that the
24 northern California planning areas, PG&E and SMUD,
25 actually have higher projected commercial employment

1 growth than in 2013, whereas the southern California
2 planning areas have lower projected growth for
3 commercial employment versus the last forecast.

4 Manufacturing output higher for all five
5 major planning areas and population growth a little bit
6 lower.

7 So all these economic projections conspire to
8 reduce our forecast a little bit compared to what we
9 had in 2013.

10 So looking first at electricity consumption
11 at the statewide level, our new mid baseline case is
12 about 1-1/2 percent lower by 2024 than it was for our
13 last forecast.

14 Electricity sales at the statewide level, our
15 new mid baseline case is around 1.7 percent lower.

16 And peak demand, this is a non-coincident
17 peak demand, meaning it's just the simple sum of
18 planning area coincident peaks, it's down by about 1.8
19 percent by 2024 comparing the new mid baseline versus
20 the old mid baseline.

21 Some planning area results. Here's the eight
22 planning areas that we forecast for, and I'll show
23 results for the five major areas.

24 We also have within these planning areas 16
25 climate zones, so climate zones being at a little bit

1 more disaggregate level, we use those to develop our
2 local area forecasts that I mentioned earlier in the
3 1.5 forms.

4 So first our two big publicly-owned
5 utilities, LADWP electricity consumption. Their mid
6 baseline case is down a little bit more than 4 percent
7 in 2024 versus the mid baseline case from last year.

8 Peak demand about the same, a little bit less
9 than 4 percent in 2024 comparing mid baseline cases.

10 SMUD, on the other hand, being in northern
11 California, as I mentioned, southern California took
12 more of a hit in terms of economic projections than
13 northern California. Electricity consumption in the
14 SMUD planning area is down by only 1/2 of 1 percent by
15 2024.

16 However, peak demand in 2024 is down by a
17 whopping 7 percent, and the reason for that is we just
18 haven't seen any load growth in SMUD in the last couple
19 years, so we have a much lower starting point. Our
20 actual peak in 2014 is significantly lower than we had
21 projected in our last forecast, so a lower starting
22 point you end up 7 percent lower by 2024.

23 And I checked with Nate Toyama at SMUD, and
24 they basically have the same sort of estimate for 2014
25 for their starting point.

1 For the IOU planning areas, just some general
2 results here. I won't be showing graphs for these, I'll
3 be showing graphs for the managed forecasts for the
4 IOUs since that's the more important one.

5 So for the three IOU planning areas,
6 consumption and sales are down by more in southern
7 California than in northern California, Edison and San
8 Diego. However, Edison's peak demand doesn't drop off
9 as much as PG&E's because of our estimate of a higher
10 weather normalized peak in 2014 for southern California
11 Edison. In other words, a higher peak in 2014 than we
12 had predicted in 2013 in our last forecast in 2013.

13 So as I mentioned, we needed to develop a
14 starting point for our peak projections, which we call
15 our weather normalized peak, so we weather normalized
16 for the three IOU what are called TAC areas,
17 transmission access charge areas, within the California
18 ISO.

19 Typically what we do is we estimate a
20 temperature response using the last historical year
21 through a regression analysis, and then we apply these
22 regression coefficients to actual historical
23 temperatures going back in years. And so we develop a
24 series or a distribution of annual peaks using
25 historical temperatures. The median of those, of that

1 distribution, becomes what we call our 1 and 2, or
2 weather normalized peak for the last historical year.

3 Unfortunately, the method that you use, the
4 number of years you use to develop the distribution can
5 have a large impact on your answer, and so we had
6 issues. We've had issues the last couple of forecasts
7 with the IOUs who have differing estimates for weather
8 normalized peaks.

9 So what we attempted to do for this updated
10 forecast and beyond is to develop a more robust method
11 for doing weather normalization that we could all sort
12 of agree on.

13 And the two basic differences for compared to
14 what we typically do is, first of all, we use three
15 years of historical data rather than one year. And the
16 reason for that is that if you use only a single year
17 to develop your temperature response, if that
18 particular weather year is really screwy for whatever
19 reason, you could end up with a screwy answer for a
20 weather normalized peak. So therefore, three years of
21 historical data gives us a better more complete
22 distribution to work with, and we're not susceptible to
23 problems caused by only using one year or one summer.

24 The other major difference is we're using 30
25 years of temperature data to develop this distribution

1 I talked about. Typically for PG&E and Edison we had
2 gone back 50 or 60 years to develop the distribution.
3 However, because of climate change and because
4 temperatures have been warming in more recent years, we
5 in discussions with the IOUs decided it would be more
6 prudent to use 30 years instead of more than that to
7 capture what's happening more recently rather than
8 going back 50 or 60 years.

9 And here are the numbers we came up with as a
10 result of this process.

11 From 2013 to 2014, a little bit of an
12 increase for each of the IOU TAC areas. And so the
13 IOUs, if they're here, may want to provide some
14 comments about these results.

15 So again, these serve as the starting points
16 for our peak demand forecasts through this weather
17 normalization process.

18 Okay, on to our managed forecasts. As I
19 mentioned before, this is where at the IOU service
20 territorial level we apply these AAEE efficiency
21 savings to a baseline forecast, and the combination of
22 those two becomes what we call a managed forecast.

23 In the last forecast cycle the three agencies
24 got together and agreed on two scenarios for managed
25 forecasts, that is, two combinations of baseline and

1 AAEE forecasts to be used for planning purposes.

2 The first managed forecast, which is meant to
3 be used for system-wide analyses, combines the mid
4 baseline case with the mid AAEE scenario.

5 For more localized analyses the agencies
6 agreed to use the mid baseline case with the low mid
7 AAEE scenario, less AAEE savings. And the reason for
8 that was recognition that as you go to a more
9 disaggregated level of analysis, your uncertainty
10 percentage-wise increases, so to be conservative, we
11 all decided for more localized analysis mid and low mid
12 AAEE scenarios.

13 Now, we don't have a new potential study from
14 the CPUC on which to base new AAEE numbers, so AAEE has
15 not changed since the last forecast, except as in the
16 case of some of the post process impacts I talked about
17 earlier, we needed to rescale.

18 In other words, our most recent historical
19 loads will have whatever AAEE savings have already
20 occurred embedded within that load data. So therefore,
21 we need to transform the AAEE savings so that they are
22 incremental to the last historical year.

23 We also needed to go out to 2025 since that's
24 how far the forecast goes out, and we consulted with
25 Navigant about this who did the last potential study

1 from which these AAEE savings came from, and they did
2 some tests in their model and they basically told us
3 extrapolating the results that we already have gets you
4 very close to what you would get if you ran the model
5 for all the individual measures. So rather than go
6 through that whole process, we just did a simple
7 extrapolation out one more year to get AAEE savings for
8 2025.

9 So here's what we end up with in terms of
10 AAEE savings. Apologize if the font's kind of small.
11 But by 2025 in the mid AAEE case, we have around 22,700
12 gigawatt hours of additional savings.

13 And these numbers are meant to be subtracted
14 directly from off the baseline forecast to give us a
15 managed forecast.

16 And for peak demand by 2025 around 5700
17 megawatts of AAEE savings for all three IOUs combined.

18 And then the low mid, the other AAEE scenario
19 we're using a little bit more than 13,000 gigawatt
20 hours by 2025 for the three IOUs combined, and around
21 3500 megawatt hours of savings.

22 So here's what the new managed forecasts look
23 like. You see two sets of lines here in this graph and
24 the upcoming graphs. We have one set of lines for each
25 managed forecast.

1 Managed forecast 1, or the ones that'll be
2 higher, are the mid baseline case combined low mid AAEE
3 savings, the scenario, the managed forecast that was
4 used for more localized analyses.

5 And then the bottom two lines represent the
6 forecasts for the managed forecasts made up of the mid
7 baseline forecast and the mid AAEE scenario, the
8 managed forecast to be used for system-wide analyses.

9 So here for PG&E, the top two lines, the red
10 line is the managed forecast that we had in 2013, and
11 the dark blue is our adjusted managed forecast.

12 So for sales for PG&E by 2024 for managed
13 forecast 1, mid baseline and low mid AAEE, we're down
14 around 0.3 percent. And for the other managed forecast,
15 for system-wide analyses, we down about 0.25 percent.

16 For peak demand, the difference is a little
17 bit higher, a little bit more than 1 percent difference
18 in a our new managed forecast versus the old managed
19 forecast.

20 And the reason for that is, go back to PG&E
21 here. The new sale starts off a little bit higher in
22 the early part of the forecast period; therefore, the
23 difference is less by the time you get to the end of
24 the forecast period, comparing to peak, which is about
25 the same as what we had predicted in 2014.

1 For Edison, as I mentioned, the southern
2 California planning areas took a bigger hit in terms of
3 economic growth projections. So for sales, managed
4 forecast 1 is down around 3 percent, and managed
5 forecast 2, mid baseline mid AEEE, is down a little bit
6 more than 3 percent.

7 Peak demand, managed forecast for Edison, not
8 down by as much, and that's because, as I mentioned
9 earlier when I was talking about the planning areas,
10 looking at the beginning of the forecast period we have
11 a higher weather normalized peak than what we had
12 predicted in 2013, so we start off higher, so the
13 difference between the two is lower by the end of the
14 forecast period compared to sales.

15 San Diego, the two managed forecasts are down
16 by around 1.8 percent by 2024, and peak demand managed
17 forecasts are down by around 2.8 percent by the end of
18 the forecast period.

19 Okay, so that's really all the material I
20 had. In terms of next steps, we request any written
21 comments from our stakeholders by Wednesday, the 17th,
22 and we will do our best to incorporate appropriate
23 comments into the forecast by the time it's adopted.
24 And our plan is to adopt the forecast by the middle of
25 January next year.

1 So with that, I guess I'll first ask the dais
2 if they have any questions or comments?

3 COMMISSIONER SCOTT: We do not.

4 MR. KAVALEC: Okay. Is there any -- are there
5 any general questions from the audience?

6 Okay. So we could then move to -- we could
7 actually get done before lunch, possibly. We can then
8 move to utility comments, assuming we have some. So
9 first I'll start with PG&E, if you have any comments on
10 the forecast, please. Yeah, if you could come to the
11 microphone here and introduce yourself.

12 COMMISSIONER SCOTT: Chris or Heather, before
13 we go there, can I just double check. We the on the
14 agenda that I have the lunch break before the utility
15 response, and I don't know if we have all of the
16 utilities here in the room with us.

17 MR. KAVALEC: Good point. Okay, let's check.

18 COMMISSIONER SCOTT: We've got PG&E.

19 MR. KAVALEC: We have PG&E here.

20 Edison? Edison is here.

21 San Diego? San Diego -- pardon me? Tim

22 Vonder, are you on the phone? Oh.

23 LADWP? And SMUD?

24 Okay. So maybe we could do the three IOUs?

25 COMMISSIONER SCOTT: Sounds good.

1 MR. KAVALEC: Okay. Yeah, and Tim Vonder is
2 on the phone so we can hear from him, too. Okay. Go
3 ahead, sorry.

4 MR. MILLAR: Good morning, everyone. So my
5 name is Dave Millar. I am a forecaster with PG&E and I
6 have responsibility for doing the long-term energy and
7 peak demand forecasts.

8 I feel like this is like I'm talking behind
9 me.

10 MR. KAVALEC: Sorry about the setup.

11 MR. MILLAR: That's okay. Maybe I'll just
12 kind of stand like this.

13 So I want to first of all thank Chris and the
14 Energy Commission for their hard work on the update.
15 We've reviewed the results and we don't have any major
16 comments about what we're seeing. It all makes sense
17 with the transversing and the economic and demographic
18 updates, and that this is sort of a limited update on
19 that with no DG or major updates to the policy driver
20 forecasts.

21 So we just wanted to kind of highlight a
22 couple differences, though, with how PG&E is currently,
23 our view on energy sales based on the bundle
24 procurement plan that we've just filed.

25 So we've filed the bundle procurement plan

1 with the mandated case, which is based on the IEPR
2 forecasts, but this time we actually filed an
3 alternative case which basically takes the CEC's
4 baseline and then adds our assumptions for distributed
5 generation and for community choice aggregation.

6 And so because of that, our alternative case
7 is somewhat of a divergent view. So what we're actually
8 seeing is our view of the company is that we're about
9 4 percent lower energy sales by 2024, and so that is
10 what's currently in the forecast update, the IEPR
11 forecast update.

12 So that's primarily driven by --

13 MR. KAVALEC: I'm sorry, that's at the
14 service territory level?

15 MR. MILLAR: At the service territory level,
16 yeah.

17 MALE VOICE: What percent again, I'm sorry?

18 MR. MILLAR: 4 percent. So that's primarily
19 driven by distributed generation, a much higher
20 forecast DG than what's currently assumed in IEPR.

21 For example, we think about there will be
22 basically double the amount of generation from our
23 customers by 2024 than what's currently assumed.

24 And then so CCA is also a major issue that we
25 want to focus on, not necessarily for this update but

1 for the 2015 IEPR process, and so we've taken a
2 probabilistic approach to how we see cities and
3 counties going to community choice aggregation, and so
4 we actually think there's going to be about 10,000
5 gigawatt hours per year of our current bundle sales
6 that's going to be served by community choice
7 aggregators in 2024. So this is a major chunk of our
8 bundled sales portfolio that we expect will be
9 departing.

10 So at this point I think the IEPR forecast
11 only has clean energy, and then that's held constant
12 through the future. So it's just something that we look
13 forward to walking collaboratively with the CEC on
14 coming up with a probabilistic approach to how CCAs
15 will depart our bundle portfolio.

16 So I think that's primarily it for us.

17 Again, we want to thank you for all the hard
18 work and we understand this is sort of a limited update
19 so at this point we're just kind of flagging these
20 issues. And look forward to working together in the
21 future.

22 MR. KVALEC: Thanks.

23 COMMISSIONER SCOTT: And you're going to
24 submit us some written comments too, right?

25 MR. MILLAR: Yes, absolutely.

1 COMMISSIONER SCOTT: Thank you.

2 MR. KAVALEC: And I'll just mention, as Dave
3 said, this is a limited update and we'll definitely
4 want to talk to you guys more about your DG forecast as
5 well as the CCAs for the 2015 IEPR forecast.

6 Okay. And who do we have for Edison?

7 MR. MARTINEZ: Good morning, this is Eduardo
8 Martinez. I'm a senior long-term demand forecast
9 planner in the Long-Term Forecast Planning office at
10 southern California Edison.

11 We have no formal comments. We've gone
12 through what you posted, but we have no comments at
13 this time.

14 I do have a technical question about
15 something you mentioned on your assumptions. Is this
16 the appropriate arena to ask you?

17 MR. KAVALEC: Sure.

18 MR. MARTINEZ: When you talked you combined
19 two of the Moody's scenarios, the long-term and I
20 forget which other one.

21 MR. KAVALEC: Short-term recession, yeah.

22 MR. MARTINEZ: Did you do an average, or how
23 do I understand how you combined it?

24 MR. KAVALEC: Oh. So it was once scenario
25 until 2018, the short-term recession scenario. And then

1 from 2019 on it was the lower long-term growth
2 scenario.

3 MR. MARTINEZ: Did you use some kind of
4 manipulation, I guess, of what, a jump-off?

5 MR. KAVALEC: There's a little bit of a kink
6 because when you transfer from one to the other, but it
7 wasn't big enough to really bother us that much.

8 MR. MARTINEZ: Okay. Just sort of interested.
9 Okay.

10 MR. KAVALEC: Okay.

11 MR. MARTINEZ: That's it.

12 MR. KAVALEC: Okay.

13 COMMISSIONER SCOTT: Thank you.

14 MR. KAVALEC: And San Diego. We can have Tim
15 speak over the phone if he wants to.

16 SAN DIEGO REPRESENTATIVE: (Inaudible)

17 MR. KAVALEC: Oh, okay.

18 SAN DIEGO REPRESENTATIVE: Hello everyone. My
19 name is Will (Inaudible). I'm with San Diego Gas and
20 Electric. I guess I'll be speaking for Tim Vonder
21 today.

22 First of all, I want to thank the Commission
23 for having this and the staff for all their hard work
24 as well as the Commissioners for --

25 COMMISSIONER SCOTT: We could wait for him if

1 he wants to try to connect in, or...

2 SAN DIEGO REPRESENTATIVE: Well, he told me a
3 couple questions that he wanted to --

4 COMMISSIONER SCOTT: Okay. So the two of you
5 are good for you to go.

6 SAN DIEGO REPRESENTATIVE: I believe so.

7 COMMISSIONER SCOTT: All right. Go ahead.

8 SAN DIEGO REPRESENTATIVE: Tim was just
9 wondering about the release dates for the next Global
10 Insight and Moody's economic update as well as the
11 release date for the Department of Finance update.

12 MR. KAVALEC: The Department of Finance, I
13 don't know. I can easily check that and get back to
14 you.

15 So the Moody's and Global Insight do updates
16 monthly, and I think quarterly they have major updates.
17 So they'll have the next major update would be the
18 beginning of 2015 for quarter number one.

19 And typically what we do is we use whatever
20 the most recent update is that we can fit in time-wise
21 to our forecast, so it was August of 2014 for this
22 forecast, and for the 2015 IEPR forecast it'll probably
23 be February or March for our preliminary forecast.

24 SAN DIEGO REPRESENTATIVE: And I believe
25 that's it. Okay. Thank you very much.

1 MR. KAVALEC: You're welcome.

2 COMMISSIONER SCOTT: You'll be submitting
3 written comments as well. Okay. And Eduardo, you as
4 well?

5 MR. MARTINEZ: At this point we will not but
6 that may change.

7 COMMISSIONER SCOTT: Oh, okay. Okay. Thanks.

8 MR. KAVALEC: And I believe we had some
9 comments from our friends at CAISO.

10 MR. EMMERT: Well, thanks Chris, and good
11 morning Commissioners. My name is Bob Emmert. I'm
12 manager for Interconnection Resources at the California
13 ISO.

14 Our primary comments are really around the
15 weather normalization process. It's a function that the
16 ISO does as well and it's something that's actually
17 what's part of a NERC standard to incorporate that into
18 modeling requirements that need to be reported under
19 various NERC standards. So we have kind of been working
20 on our weather normalizing process as well as the ISO
21 to improve it and to formalize it, and we've been doing
22 that for the last few years.

23 We do have a concern with the weather
24 normalized number that the CEC has come up with. It's a
25 pretty important number since that's the base number

1 that all the forecasts begin with, so if your numbers
2 are a bit too high then your entire forecast is going
3 to track higher.

4 And just to kind of give you some reference.
5 For last summer 2014 our actual peak was around 44,700
6 megawatts in the CAISO balancing authority, and we
7 adjusted that up in our weather normalization process
8 to around 46,500, so nearly 2,000 megawatts higher.

9 But the CEC actually goes up to 49,000, so
10 that's roughly 2,500 megawatts higher than our weather
11 normalized number. So at this point I think we would
12 request that we maybe even sit down with the CEC and
13 kind of go through our numbers and do some comparison
14 and see if we can both improve on this process and come
15 to a number that I think would be closer and more
16 agreeable from all the parties. Thank you.

17 MR. KAVALEC: Okay. I'll just respond that we
18 do our weather normalization differently than Cal ISO
19 does. We do weather normalized peak for each of the
20 individual TAC areas. We add those up and then we apply
21 a coincidence factor.

22 So it could be that the coincidence factor
23 that we're applying to go from the sum of individual
24 TACs to a weather normalized peak for CAISO is too
25 high. We're taking a look at that now.

1 So certainly we should sit down in the next
2 week or so, the sooner the better, and talk about the
3 differences that we have.

4 COMMISSIONER SCOTT: Thanks, Chris. I think
5 it would also be helpful if there are differences that
6 are carried forward that we make sure it's clear how
7 the Energy Commission calculation is different than the
8 CAISO calculation so that people understand when they
9 read the report.

10 MR. KAVALEC: Okay.

11 COMMISSIONER SCOTT: Thanks. Thanks for
12 taking the time to sit down with CAISO.

13 So just for the record, we're hearing from
14 PG&E and also from SCE that they would like to have a
15 weather normalization conversation with Chris and the
16 team as well. And San Diego Gas & Electric.

17 MR. KAVALEC: Okay. So I understand we have
18 Nate Toyama from SMUD on the phone, so we'll ask him if
19 he has any comments he would like to make for the
20 record first.

21 MR. TOYAMA: Can you hear me, Chris, on this
22 phone?

23 MR. KAVALEC: Yes. I hear you.

24 MR. TOYAMA: Okay, good. I have a question
25 really. I notice that when you presented SMUD's

1 forecast did you include any of our SMUD program energy
2 efficiency?

3 MR. KAVALEC: We included only those
4 estimates of the savings from those programs that are
5 already in place through 2013. We didn't project
6 efficiency program savings beyond that.

7 MR. TOYAMA: Okay. Then my comment would be
8 that when we submit all our information to the various
9 regulatory agencies including CEC of course, that we
10 consider our managed forecast to include not only some
11 of the items that you included, the DG, the EV, but we
12 also have a section on energy efficiency.

13 And when I compared the forecast that you
14 presented with our current forecast, we start off very
15 similarly at the same level like you discussed,
16 particularly with the peak demand, but going forward we
17 have a slightly higher unmanaged peak, about 2 percent
18 higher. It sort of levels off at 2025, but our managed
19 peak as well as our managed sales tend to be relatively
20 flat, roughly about maybe about a .2 to .3 percent
21 annual growth rate versus a 1.4 percent that we have
22 for our unmanaged (inaudible) 1.2 percent that you have
23 for your forecast for SMUD.

24 So I just want to emphasize that when we do
25 our planning for budgets, for resources, as well as

1 submittals to the WECC for our forecast we do include
2 that energy efficiency portion. It's roughly about 1.5
3 percent, and although we don't have a budget, we do
4 have a policy for the next ten years regarding the
5 level of energy efficiency that we hope to achieve with
6 respect to our sales, which is roughly about 1.5
7 percent, and our peak, which is about .9 percent.

8 So those are my comments.

9 MR. KAVALEC: Okay. And I should mention that
10 when I talk about these AAEE savings, right now we have
11 estimates only for the IOUs. We want to try and develop
12 something similar for the POUs for the 2015 IEPR
13 forecast, so that would be taking into account what
14 Nate's talking about, additional efficiency savings
15 beyond what's already been budgeted. So that's
16 something we're hoping to do for the 2015 IEPR.

17 MR. TOYAMA: Okay. Well, one other point is
18 that we will be submitting our other information or
19 rather our new information for, I guess the February
20 and the April IEPR submittals. What I was talking about
21 and what we've discussed earlier last week was relative
22 to our current forecast, which was developed last year
23 at this time, but you'll see a new one coming out
24 pretty soon.

25 MR. KAVALEC: Yeah, so in your filings in

1 February and April you'll have a brand new forecast?

2 MR. TOYAMA: That's correct.

3 MR. KAVALEC: Okay.

4 MR. TOYAMA: That's it for me.

5 MR. KAVALEC: Okay. Thanks, Nate.

6 MR. TOYAMA: All right.

7 COMMISSIONER SCOTT: Thank you.

8 MR. KAVALEC: So on the line also we have
9 some comments from Doris Chow from the CPUC.

10 Doris, are you there? I believe we've opened
11 your line here.

12 MS. CHOW: Hi, can you guys hear me? This is
13 Doris Chow from CPUC?

14 MR. KAVALEC: Yeah, we hear you.

15 MS. CHOW: Oh, okay. Sorry, I think
16 (inaudible) earlier.

17 Yeah, I just want to say that I want to be
18 part of the conversation when the CEC meets with the
19 CAISO on the weather normalization part. That's all.

20 MR. KAVALEC: You're more than welcome,
21 Doris.

22 MS. CHOW: Thanks.

23 COMMISSIONER SCOTT: Do we have anyone from
24 LADWP on the line? So just for folks on the line, we're
25 currently checking to see if anyone from LADWP is

1 available to comment.

2 MR. KVALEC: It looks like we do not.

3 COMMISSIONER SCOTT: All right, so why don't
4 we do this. Why don't we do some public comment so if
5 there are folks who are on the line now that would like
6 to make public comment. And then I think what we would
7 do is go ahead and break. We said that we would be back
8 by 12:45, and so at 12:45 we'll pick up with LADWP and
9 any remaining public comments.

10 But if there are folks on the line who would
11 like to make a public comment now, why don't we go
12 ahead and do that. Or in the room. Any hand raisers on
13 the line there?

14 Okay. Well, so this is what we will do. The
15 agenda that we have says that we would break for lunch,
16 so we're going to go ahead and do that now, you get a
17 little bit of extra time. And then we would be gone for
18 one hour, so that would be 12:45.

19 We will reconvene at 12:45, and I hope that
20 we will have Los Angeles Department of Water and Power
21 on the line at that point in time so we can hear from
22 them. And if there are any public comments at that
23 time, we will listen to those as well. So please come
24 back at 12:45, and thank everybody for being here.

25 (Off the record at 11:05 a.m.)

1 (Reconvene at 12:49 p.m.)

2 MS. RAITT: We are back from our lunch break
3 to see if anyone else wanted to make comments on the
4 2014 IEPR California Energy Demand Update Forecast. So
5 is there anyone in the room who wanted to make some
6 public comments?

7 And if anyone on WebEx wants to, please use
8 your chat function to let us know you'd like to
9 comment.

10 COMMISSIONER SCOTT: Let's just note for the
11 record that we did hear from Los Angeles Department of
12 Water and Power, and they don't have any oral comments
13 that they want to make today.

14 And so we're just looking for if there's any
15 public comment in the room or any public comment on the
16 phone, we'd be happy to hear that.

17 MS. RAITT: Thank you. No one on WebEx, and
18 there's no callers, so...

19 COMMISSIONER SCOTT: Well, then thank you,
20 everyone, for reconvening with us. I urge everyone if
21 you've got comments that you'd like to make sure that
22 we have, please write them down and get them to us.
23 They are due on December 17th. And you can see by the
24 slide here how to get the information in.

25 And anything else?

1 MS. RAITT: Thank you.

2 COMMISSIONER SCOTT: Okay, thank you,
3 everyone. We're adjourned.

4 (Adjourned at 12:50 p.m.)
