Remote Intelligent Switch

Presenter: Bryan Pham
Senior Manager - Automation/Communications
Next-Gen Distribution Automation

**DRIVERS**
- Current distribution automation technology relies heavily on human intervention, aging technology architecture, and isn’t optimized for integrating distributed energy resources (DER).
- SCE’s current switching scheme can take several minutes to isolate half the load of an affected circuit and doesn’t support bi-directional power flow.
- No reliable or effective method exists to detect high-impedance faults.

**SCOPE**
- The Next-Generation Distribution Automation Automation project will demonstrate:
  - **Remote Intelligent Switch (RIS):** auto circuit reconfiguration.
  - **Remote Fault Indicators (RFIs):** accurately identify faults quickly.
  - **Intelligent Fuse:** automated branch line protection.
  - **High Impedance Fault Detection:** detect downed energized lines.

**BENEFITS**
- Integrate DER through greater telemetry and programmable logic controls.
- Minimize quantity of customer service interruptions.
- Quicker fault detection, isolation, and restoration.
- Improve communication between automation devices.
- Identify an effective and reliable method for detecting high impedances.
## RIS Goals and Benefits

<table>

System Capability: Next Generation Distribution Automation

Capability Description:

- Advanced Automation for fault detection & auto circuit reconfigurations
  - Isolate and restore interrupted load as quickly as possible.
  - Incorporate greater levels of telemetry into an automated switch solution
  - Interoperability with various interrupters, communication systems, protocols, and other deployable field devices
  - Adopt a flexible solution capable of supporting various circuit topologies and communication conditions.
  - Remote configuration, and commissioning capabilities

- Bi-directional protection
- Voltage optimization
- Power flow optimization
- Distributed intelligence (Local & Centralized)
- Interoperability

- Flexibility
  - Handles Multiple communication protocol – DNP3, IEC61850
  - Capable of distributed intelligence and central intelligence
  - Capable of handle low speed and high speed communication
  - Capable of various logic/algorithm programming
RIS Overview

Advanced Automation for fault detection and auto circuit reconfiguration.

- Isolate and restore load quickly
- Incorporate greater levels of telemetry
- Deployment flexibility supporting various circuit topologies
- Interoperability with communication systems, protocols, and interrupters
- Supports DER integration.
2.5 Scheme

- Two Substation Sources
- Two Mid-Switches per circuit
- One Tie-Switch
3.5 Scheme

- Two Substation Sources
- Three Mid-Switches per circuit
- One Tie-Switch
2.5 Extended Scheme

- Four Substation Sources
- Two Mid-Switches per circuit
- Two Tie-Switches per circuit

Next Steps – Remote Intelligent Switch

– Slow speed Communication
  • Conduct factory acceptance testing (FAT) – Q3 2016
  • Site acceptance testing (SAT) – Q3 2016
    • Lab Test at Advanced Technology Lab
    • Equipment Demonstration & Evaluation 12kV Facility
  • Pilot Project – Johanna Substation – Q4 2016
    • Install and commission 5 RIS on the Poker & Bingo 12kV Circuits by year-end 2016

– High Speed Communication – 2018-2019
  • When new FAN high speed radio is selected
