David,

As per our discussion, I couldn't find any previous email that confirmed SDG&E's review of the 85MW repowering of the El Centro #3 Plant in 2009 report by IID. Thus let this email serve as confirmation that SDG&E does not have any comments on this report.

I also attached the previous e-mails regarding the resolution of SDG&E's comments for the Niland Generation Station report.

David,

Thanks you for your quick response to my comments. However, I'm still a little confused in that if the only change between the pre and post project cases was the addition of the Niland generation, and overloads on the 161/92 transformer were not seen in the pre project case, how can the following statement be made.

"The conclusion from this analysis finds that the interconnection of the Niland generation does not in itself impact the loading on the El Centro 161/92kV transformer."

In other words, if for the IV-NG outage the schedules are the same for the pre and post project cases the schedules should not be associated with the increased loading on the transformer. Isn't it really related to the Niland generation (i.e IID's chosen generator dispatch).

SDG&E appreciates the opportunity to comment on this SIS. Please call me with any questions.

Thank you ,

Brad
