Re: Application for Locally Adopted Energy Standards by the City of Chula Vista In Accordance With Section 10-106 of the California Code of Regulations, Title 24, Part 1

Dear Commissioners,

At its meeting of January 10, 2012, City Council placed an ordinance mandating cool roof standards on first reading and directed staff to bring it to Council for second reading and adoption after CEC review and approval. See attached RECORD OF ACTION TAKEN AT THE REGULAR MEETING OF THE CITY COUNCIL OF THE CITY OF CHULA VISTA ON JANUARY 10, 2012.

At its meeting, City Council made the determination that mandating Tier 2 cool roof standards for new low-rise residential buildings in Climate Zone 10 will not require buildings to consume more energy than permitted by the current California Energy Code and are determined to be cost effective based on a cost-effectiveness study by Gabel Associates, LLC.

Enclosed with this application are the following:

1. The proposed Ordinance which includes statements that the proposed standards are cost-effective and will not require buildings to consume more energy than permitted by the current California Energy Code, and evidence that the Ordinance was approved and placed on first reading at a noticed public meeting.

2. A study with supporting analysis showing how the City determined the energy savings and that the proposed standards are cost effective.

Per the request of Commission Staff, we would like to express to you our firm commitment to have the City enforce the current Title 24 Building Energy Efficiency Standards as part of the implementation of our local energy ordinance. As the Building Official, I will work with staff involved in energy plan review and field inspection to improve their working knowledge of the
energy standards, including special training as needed which focuses on enforcement of the energy standards and the special requirements of local energy standards.

Respectfully,

Lou El-Khazen, PE, CBO, CASp
Building Official
(619) 409-1960
lelkhazen@chulavistaca.gov
The following is the action taken by the Chula Vista City Council at its meeting of January 10, 2012 regarding an Ordinance of the City of Chula Vista related to green building standards.

ACTION: Mayor Cox moved to place the Ordinance of the City of Chula Vista Amending Chapter 15.12, Green Building Standards, of the Chula Vista Municipal Code and adding Section 15.12.030, Cool Roof, attached hereto as Attachment 1, on first reading. Deputy Mayor Bensoussan seconded the motion, and it carried with the following vote: AYES: Aguilar, Bensoussan, Castaneda, Ramirez, and Cox; NAYS: None; ABSTENTIONS: None.
ORDINANCE NO. 

ORDINANCE OF THE CITY OF CHULA VISTA AMENDING CHAPTER 15.12, GREEN BUILDING STANDARDS, OF THE CHULA VISTA MUNICIPAL CODE, ADDING SECTION 15.12.030, COOL ROOF

WHEREAS, on May 3, 2011 City Council approved Resolution 2011-076 in which City Council adopted the Climate Adaptation Plans and approved their implementation; and

WHEREAS, the adopted Climate Adaptation Strategies will help reduce the City’s future risks and costs from expected local climate change impacts; and

WHEREAS, the Implementation Plan for Strategy #3, Cool Roofs, proposed amending the City’s Green Building Standards, Chula Vista Municipal Code (CVMC) Chapter 15.12, to require what are currently voluntary cool roof measures in the 2010 California Green Building Standards Code on new low-rise residential developments; and

WHEREAS, the California Energy Commission determined that because cool roofing is currently one of the compliance options available in the California Energy Code and because it affects the energy efficiency of buildings, mandating cool roofs requires the California Energy Commission’s review and approval prior to a cool roof ordinance taking effect; and

WHEREAS, the California Energy Commission’s review and approval process requires City Council’s determination that the proposed local standards will not require buildings to consume more energy than permitted by the current California Energy Code and are cost-effective; and

WHEREAS, a study prepared by Gabel Associates, LLC analyzed the energy savings and cost-effectiveness of requiring Tier 1 and Tier 2 residential cool roof standards, which are currently voluntary standards in the 2010 California Green Building Standards Code, in the two Climate Zones that are within the boundary of Chula Vista; and

WHEREAS, the results of the study showed that requiring Tier 1 or Tier 2 cool roof standards in Climate Zone 7 is not cost-effective, however the requirements are cost-effective in Climate Zone 10; and

WHEREAS, based on the results of the study, Gable Associates, LLC recommends requiring Tier 1 or Tier 2 standards only in Climate Zone 10; and

WHEREAS, based on the results of the study, Tier 2 cool roof standards in Climate Zone 10 are more cost-effective than Tier 1 standards; and

WHEREAS, based on staff research, the majority of new residential developments in Chula Vista will have steep-sloped roofs with concrete or clay tile roofing that will meet or exceed Tier 1 cool roof standards; and
WHEREAS, the Director of Development Services has reviewed the proposed activity for compliance with the California Environmental Quality Act (CEQA) and has determined that the activity falls within the Class 8 Categorical Exemption pursuant to California Code of Regulations Title 14, Chapter 3, Article 19 (the “State CEQA Guidelines”) section 15308 and therefore is exempt from environmental review; and notwithstanding the Class 8 Categorical Exemption, the Director of Development Services has further determined that there is also no possibility that the activity may have a significant effect on the environment; therefore, pursuant to section 15061(b)(3) of the State CEQA Guidelines the activity is exempt from the provisions of CEQA.

SECTION I: NOW THEREFORE BE IT ORDAINED, that the City Council of the City of Chula Vista does hereby find and determine that:

Mandating Tier 2 cool roof standards in Climate Zone 10 will not require buildings to consume more energy than permitted by the current California Energy Code; and

Tier 2 cool roof standards in Climate Zone 10 are cost-effective; and

Mandating Tier 2 cool roof standards in Climate Zone 10 is necessary due to local climatic and environmental conditions.

SECTION II: BE IT FURTHER ORDAINED, that the City Council of the City of Chula Vista does hereby find and determine that Chapter 15.12 of the Chula Vista Municipal Code is hereby amended by adding Section 15.12.030, Cool Roof, as follows:

Section 15.12.030 Cool Roof
The voluntary Tier 2 cool roof measures found in Subsection A4.106.5 of the California Green Building Standards Code are mandatory in Climate Zone 10 for new low-rise residential developments.

SECTION III: EFFECTIVE DATE

This Ordinance shall take effect after the City Council acknowledges receipt of actions taken by the California Energy Commission pursuant to Title 24, Part 1 of the California Code of Regulations (the “California Administrative Code”) section 10-106 but no sooner than the thirtieth day from and after this Ordinance’s final adoption.

City Attorney

5-30
Cost-Effectiveness of Cool Roof for a Proposed Chula Vista Energy Ordinance

June 30, 2011

Report prepared for:
Lou El-Khazen, PE, CBO
City of Chula Vista
276 Fourth Avenue
Chula Vista, CA 91910

mike@gabelenergy.com
1.0 Executive Summary

Gabel Associates has researched and reviewed the energy cost-effectiveness of a proposed City of Chula Vista ordinance which would require that low-rise residential buildings include "cool roof" coatings that meet the 2010 CALGreen Tier 1 or Tier 2 prescriptive criteria. If such an ordinance is adopted, this study may be included in the City's application to the California Energy Commission which must meet the criteria specified in Section 10-106 of the California Code of Regulations, Title 24, Part 1, LOCALLY ADOPTED ENERGY STANDARDS. A proposed Chula Vista ordinance would be enforceable after the Commission reviews and approves the local energy standards as meeting all requirements of Section 10-106; and the Ordinance is filed with the Building Standards Commission.

Case studies of two low-rise residential building designs were used in Climate Zones 7 and 10 to consider the cost-effectiveness of going from roofs which do not meet any cool roof requirements to the Tier 1 and Tier 2 levels specified in CALGreen for Climate Zone 10. These case studies, as directed by City Staff, have been used to consider the following questions for common building types in each climate zone:

- What is the incremental (added) construction cost per square foot of cool roofs performing at or above the Tier 1 levels?
- What is the annual energy saving in each case study? What is the annual energy cost saving for each scenario?
- What is the Simple Payback for the added energy measures?
- Which cool roofs in which climate zones appear cost-effective?
2.0 Potential Impacts of a Cool Roof Ordinance

Energy performance impacts of a proposed cool roof ordinance have been evaluated using two case studies which reflect the range of low-rise residential buildings typical in Chula Vista:

- 2,500 sq.ft., 2-story single family house
- 8,442 sq.ft., 8 unit 2-story multi-family building

Case Study Method

The methodology used in these case studies is based on the way that real buildings are designed and evaluated in just meeting or exceeding the energy standards.

(a) A base case for each building design just meets the CALGreen Tier 1 performance requirements so that it exceed the 2008 Standards by 15%, but with no cool roof specification (i.e., solar reflectance = 0.08, thermal emittance = 0.85). The air conditioning system is assumed to just meet the prescriptive requirements: 13.0 SEER, 10.0 EER, R-6 ducts in a standard ventilated attic.

Note: the current Chula Vista energy ordinance requires 15% better than Title for Climate Zone 7, and 20% better in Climate Zone 10. The difference in Climate Zone 10 (20% vs. 15%) is not significant in determining the change (i.e., delta) in energy use from the various cool roof scenarios from the baseline.

(b) For each building prototype, a series of computer simulations are performed, first with no radiant barrier:
   - Low-slope, Tier 1: Solar Reflectance = 0.55, Emittance = 0.75
   - Steep-slope, Lightweight, Tier 1: Solar Reflectance = 0.20, Emittance = 0.75
   - Steep-slope, Heavyweight, Tier 1: Solar Reflectance = 0.15, Emittance = 0.75
   - Low-slope, Tier 2: Solar Reflectance = 0.65, Emittance = 0.85
   - Steep-slope, Lightweight, Tier 2: Solar Reflectance = 0.23, Emittance = 0.85
   - Steep slope, Heavyweight, Tier 2: Solar Reflectance = 0.23, Emittance = 0.85

(c) A minimum and maximum range of incremental costs of added energy measures is established from the research presented at the California Energy Commission on June 10, 2011 in the 2013 Standards public workshops (see Appendix 1). Site energy KWh and Therms is calculated for each run to establish the annual energy savings, and energy cost savings as compared with the base case.

(d) Steps “a”, “b” and “c” above are repeated after first including a radiant barrier in the base case and the cool roof variations. The point is to see what extent first including a radiant barrier affects the incremental energy impacts of cool roofs.
**Incremental Costs**

A California Energy Commission study (6/10/11) presented in support of the 2013 standards development work is included as Appendix A. This presentation includes recent data on the incremental costs of various types of cool roof. The incremental cost cool roof assumptions of this report are as follows:

- Steep Slope Lightweight, No Cool Roof to Tier 1 or 2: $0.00 - $0.10/sf, Avg = $0.05/sf
- Steep Slope Heavyweight (Ceramic Tile), No Cool Roof to Tier 1 or 2: $0.05/sf
- Flat/Low Slope (Built-Up Roof or Shingles), No Cool Roof to Tier 1 or 2: $0.00 - $1.00, Avg = $0.50
3.0 Results and Cost Effectiveness

The tables in this section are based upon the following:

- The assumption of air conditioning where there is some cooling energy savings from cool roof coatings;

- Incremental site electricity (kWh) and natural gas (therms) saved per year as calculated using the most current 2008 Standards state-approved software, Micropas v8.1;

- Average utility rates for residential buildings: $0.19/kWh for electricity and $1.14/therm for natural gas (in constant dollars);

- The assumption that there is no change (i.e., no inflation or deflation) in utility rates in constant dollars over time

- The assumption that there is no increase in summer temperatures even though most scientific studies predict that global climate change will increase temperatures in the Western U.S. which will increase air conditioning energy use

- Simple Payback includes neither the cost of financing nor any external cost associated with global climate change

Based on California Energy Commission studies, the useful life of lightweight cool roof coatings is assumed to be 15 years. A built-up-roof or asphalt shingle cool roof with a payback of around 15 years or less would be considered cost-effective. Steep slope heavyweight cool roofs such as ceramic tile may be expected to last up to 30 years.

The data summarized here is intended to be illustrative, not comprehensive or definitive, in demonstrating the scale of typical results and the variability of results depending on the selection of a particular cool roof CRRC rating and the actual longevity of the roof coating used.

4.0 Conclusions and Recommendation

Climate Zone 7

Based on the site energy results obtained by modeling the single family home case study with the 2008 state-approve version of Micropas v8.1, steep-sloped roofs in Climate Zone 7 do not appear to be cost-effective for either Lightweight or Heavyweight roof types (with or without the presence of radiant barriers). This is consistent with the fact that Climate Zone 7 is a mild climate with very low air conditioning use. The incremental cooling energy savings from cool roof alone are projected to be very low, even though the typical incremental costs for steep slope cool roofs are also small. For low-sloped or flat roofs as modeled in the two-story multi-family building, neither Tier 1 or Tier 2 cool roof requirements are cost-effective for the same reason.

Climate Zone 10

For steep-sloped roofs in Climate Zone 10, lightweight cool roofs appear extremely cost-effective for both Tier 1 and Tier 2 values with or without a radiant barrier. Assuming a 30 year life of ceramic tile, heavyweight cool roofs are marginally cost effective for Tier 1 with a radiant barrier, but apparently easily cost-effective without radiant barrier achieving Tier 1; and more cost-effective in meeting Tier 2 values with or without a radiant barrier. This makes sense in that Climate Zone 10 has much greater cooling loads than Climate Zone 7, while the incremental cost of cool roof remains the same.

Low-sloped or flat roofs in the two-story multi-family building are cost-effective in Climate Zone 10 with or without a radiant barrier.

Recommendation

If the City wishes to proceed with a local reach code which makes selected cool roof requirements mandatory, our recommendation based on this limited study is to implement either Tier 1 or Tier 2 values in Climate Zone 10 only; and not have any cool roof requirements for buildings in Climate Zone 7. This is based on the distinctly different cost-effectiveness profiles of the same buildings when comparing them in CZ7 vs. CZ10.

*Premiums are the extra cost, per square foot of roof area, of installing the cool roof option as compared with the corresponding non-cool option. Premiums are based on achieving the minimum cool roof characteristics described in Table 1. Values are approximate, and are based on discussions with roofing contractors, manufacturers, wholesalers, and RSMeans cost data.

*These roofs may be used in steep slope applications where cool roof requirements are less stringent. Uncoated metal roofs normally meet requirements for steep slope, but not for low slope. Premiums for shingles & tiles are based on steep slope requirements. All other premiums are based on low slope requirements.

Costs — Moving from No Standard

• RS Means:
  - Built-up roofing ≈ $2.60/ft^2
  - Single-ply membrane ≈ $1.75/ft^2
  - Suggests cost savings in moving to a cool roof even without energy benefits

• Cost Premium from No Standard to $R_{aged} = 0.70$

  Conservative estimate of $0.50/ft^2$
