RE: Section 118 of Title 24

Dear Elaine:

I am writing to you regarding proposed alternatives to Table 118-C relating to performance properties of field-applied coatings. The D-522 alternative for cold weather flexibility is an important addition for measuring coating performance.

ERSystems produces two products that are used over asphaltic substrates, common in CA, that will meet the new flexibility alternative. The first product, Eraguard 500, has been sold into the market for over twelve years. In the last four years we have had approximately 1 million square feet of the product applied, primarily in climates of the northern plains states, which are easily as cold as it gets in CA.

The second product is Erlastic and has been on the market for seven years. Over the last four years approximately 4 million square feet of the product has been installed in climates as described above and including some in CA.

These products have a proven performance record in climates as severe and varied as CA . We are in support of the proposed alternative and believe it will provide value to the residents and businesses of CA.

Thank you for your consideration.

James Leonard, President
