PRIMARY FUNCTIONS OF THE CALIFORNIA ENERGY COMMISSION

Advancing State Energy Policy
Investing in Energy Innovation
Developing Renewable Energy
Preparing for Energy Emergencies

Achieving Energy Efficiency
Transforming Transportation
Overseeing Energy Infrastructure
Intergovernmental Collaboration
The Warren-Alquist Act established the California Energy Commission (CEC) in 1974

- Authority to develop and maintain Building Energy Efficiency Standards (Energy Code)
- Requires the CEC to update periodically, usually every three years
- Requires the Energy Code to be cost-effective over the economic life of the building
• Increase building energy efficiency while maintaining cost-effectiveness
• Contribute to California’s greenhouse gas (GHG) reduction goals
• Reduce impact on grid through efficiency and photovoltaic (PV) generation
• Provide independent compliance paths for both mixed-fuel and all-electric homes
• Develop and provide tools for CalGreen Part 11 reach codes and other beyond code practices
2019 Lessons Learned

• New developments had significant impacts on zero net energy goals

• Large utility scale solar to meet 50% renewable portfolio standards requirements

• Net energy metering (NEM) rules and time-of-use (TOU) compensation for customer-owned generation
  
  o NEM rules currently treat grid as virtual storage, where extra generation can be stored and used later
  
  o NEM and life-cycle costing are laws and we must operate within their confines
Future Energy Codes

- First priority is energy efficiency
- Transitioning to GHG-based metric that promotes electrification
- Moving away from equal hourly netting to support grid flexibility
- Maintaining solar self-utilization and demand response measures
Effective January 1, 2020

- Building permit applications submitted on or after effective date
- Must use 2019 software and forms
2019 Energy Savings

Low-rise residential

- 7% more efficient than 2016 Standards
- Energy consumption reduced by an average 53% with PV
- Monthly lifecycle cost is $40 with savings of $80 for typical home
- GHG emission reduction of 700k metric tons over 3 years
Residential Changes Summary

Performance
• New energy design rating (EDR)
• PV and quality insulation installation (QII) part of the standard design

Water heaters
• Prescriptive options for heat pump

Solar photovoltaic prescriptive requirement
• Several exceptions to reduce PV size

HVAC - Indoor air quality (IAQ)
• MERV 13 filtration
• ASHRAE 62.2-2016 applied with modifications
• HERS verification for kitchen range hoods

Increased efficiency for envelope
• New U-factor for doors
• Wall and ceiling insulation
• QII prescriptive requirement
CALIFORNIA’S 2019 RESIDENTIAL BUILDING ENERGY EFFICIENCY STANDARDS

CALIFORNIA ENERGY COMMISSION

The state’s energy efficiency standards for new buildings and appliances have saved consumers billions in lower electricity and natural gas bills. The 2019 Building Energy Efficiency Standards for residential buildings includes a first-in-the-nation requirement to install solar photovoltaic systems. Other features enable homes to reduce the electricity demand from the grid, helping to reduce energy bills and the carbon footprint.

$19,000 SAVINGS OVER A 30 YR. MORTGAGE

INITIAL COST $9,500

Solar Photovoltaic System
Promote installing solar photovoltaic systems in newly constructed residential buildings. The systems include smart inverters with optional battery storage. This will increase the self-utilization of the electricity generated to power the home’s electricity loads including plug at appliances. California is the first state in the nation to require smart systems at homes.

Healthy Indoor Air Quality
Enable using highly efficient filters that trap hazardous particulates from both indoor air and cooking and improve kitchen ventilation systems. Moving air around and in and out of the home while filtering out allergens and other particles makes the home healthier.

Demand Response Compliance Options
Encourage battery storage and heat pump water heaters that shift the energy use of the house from peak periods to off-peak periods. Utilities moving to time-of-use pricing assist the grid to meet the state’s climate change goals and help homes reduce energy bills.

BuildingEnvelope
Strengthen insulation in attics, walls and windows to improve comfort and energy savings. Keeping the heat out during the summer and warm air during the winter makes a home more resilient to climate change.
Envelope Changes Summary

Residential

• Addition of exterior door labeling requirements
  o 25% or more glass is fenestration

• Increased window efficiency
  o Max U-factor of 0.30, SHGC of 0.23

• High performance attics
  o R-19 between rafters becomes new baseline

• High performance walls
  o Max U-factor of 0.048

• QII prescriptive baseline
  o HERS verification required
Quality Insulation Installation
Prescriptive Requirements
Residential § 150.1(c)1E

Quality insulation installation (QII)

- Requires HERS verification of installed insulation and exterior air barrier
- Meet criteria in Reference Residential Appendix RA3.5
- Not mandatory, but difficult to offset
- Modeling without can have 7-11% penalty
- Climate zone 7 not required for multifamily
HVAC Changes Summary

Residential

• Aligns mid-size equipment efficiencies with ASHRAE 90.1
• Changes requirements for duct insulation in conditioned spaces
• Aligns IAQ with 2016 ASHRAE 62.2 with some amendments
• Modified requirements for small duct high velocity systems
• Increased fan efficiency for furnace air handlers
Water Heating Changes Summary

Residential

- Heat pump water heaters can be installed prescriptively in climate zones 1-15
- Gas water heaters must have dedicated 125 volt, 20-amp receptacle within 3 feet, connected to panel with 3 conductor 10 AWG wire
- **Alterations:** Electric water heater can be installed if natural gas is not connected to the existing water heater location
Photovoltaic Prescriptive Requirements

Residential § 150.1(c)14

- PV systems sized to offset annual kWhs of mixed-fuel home
- Meet requirements in Reference Joint Appendix JA11
  - Verification of number of panels, panel type, size, orientation, tilt, and shading
  - Solar access tools approved
  - Remote monitoring capability required, with mobile app
- Several exceptions
Photovoltaic Prescriptive Requirements

Residential § 150.1(c)14

- Average PV size is 2.8 kW
- Average PV installed in existing homes is 7.2 kW
- Varies with climate zone and house size

Photovoltaic
Prescriptive Requirements

Residential § 150.1(c)14

Exceptions

• Shading due to external barriers
• Dwelling unit plan with solar ready approved prior to January 1, 2020
• Variances allowed for multi-story buildings with limited roof space
• PV size may be reduced 25% with battery storage system (minimum 7.5 kWh)
PV Compliance Options

Residential

Rooftop Installation
- Outright purchase – big initial investment by homeowner, larger monthly savings
- Lease and PPA options – little or no initial investment, smaller monthly savings

Community Solar
- Alternative to rooftop PVs
- Must be approved by the CEC
CalGreen and optional reach codes may specify more aggressive performance targets than base codes

- Tier 1 and Tier 2 targets can be reached
  - Greater energy efficiency
  - Larger PV systems with at least 5 kWh battery storage system
- Approved software can be used to demonstrate compliance

2019 Energy Savings

Nonresidential, high-rise residential, hotel and motels

- 30% more efficient than 2016 Standards
- Savings due mainly to lighting upgrades
- LED lighting first year savings of 480 GWh
Nonresidential Changes Summary

Healthcare facilities included
  • Several exceptions

Envelope U-factors
  • Values lowered

Lighting updates
  • Lighting power densities based on LEDs
  • Indoor lighting alterations simplified

Indoor air quality
  • MERV 13 filtration

HVAC ventilation
  • ASHRAE 62.1-2016 applied
    o Minimum exhaust rates
  • ASHRAE 62.2 applied to high-rise residential
    o Verification for kitchen range hoods

Covered process requirements for laboratories
  • Fan power and fume hood
CALIFORNIA'S 2019 NONRESIDENTIAL BUILDING ENERGY EFFICIENCY STANDARDS

CALIFORNIA ENERGY COMMISSION

The state's energy efficiency standards for new buildings and appliances have saved consumers billions in lower electricity and natural gas bills. The 2019 Building Energy Efficiency Standards for nonresidential buildings include better lighting and ventilation. The standards also extend requirements for the first time to newly constructed healthcare facilities.

HEALTHY INDOOR AIR QUALITY

Enable using highly efficient filters that trap hazardous particulates from both outdoor air and cooking and improve kitchen ventilation systems. Moving air around and in and out of the home while filtering out allergens and other particles helps improve the health of a building. The standards add airflow requirements specific to small duct, high velocity systems, and sets, sensor control requirements.

HEALTHCARE FACILITIES

For the first time, energy efficiency standards extend to newly constructed healthcare facilities and incorporates the appropriate application of standards.

LIGHTING

Update indoor and outdoor lighting values to assure the use of LED lighting. LED lights use little energy and will save money on monthly electricity bills by meeting smaller operating budgets for commercial buildings. Maintenance costs are reduced because bulbs do not need to be changed as often. The standards also add occupancy sensing requirements for restrooms.
Lighting and Indoor Air Quality Changes Summary

Nonresidential

**Lighting**
- Indoor and outdoor lighting baseline shifts to LEDs
  - LEDs now cost effective and feasible
  - Likely will not affect lighting designers
  - Most impact will be on envelope design
    - Less energy savings from lighting to trade-off with envelope
- New power adjustment factors (PAF) for advanced daylighting design

**Air filtration**
- MERV 13 filters now mandatory
  - Should expect higher surface area 1” filters or 2” filters
HVAC and Ventilation Changes

Summary

Nonresidential

HVAC
• Heat pump minimum efficiency increased
• VRF system minimum efficiency increased
• Cooling tower fans, pumps minimum efficiency increased

Ventilation
• Incorporated natural and exhaust ventilation procedures of 2016 ASHRAE 62.1
• High-rise residential dwelling units meet ASHRAE 62.2
  o Must be a balanced system; or
  o A continuously operating supply or exhaust system
    ▪ HERS blower door testing required
  o HERS Verification for kitchen range hoods
Covered Processes and Healthcare Changes Summary

Nonresidential

Covered processes

• Fan efficiency and automatic sash closure requirements for laboratory fume hoods
  o Acceptance testing required
• Efficiency and system control requirements for adiabatic condensers
  o Applies to refrigerated warehouses and supermarkets

Healthcare facilities are now included

• I-1 and I-2 occupancy
• There are many exceptions for these occupancies
2019 Building Energy Efficiency Standards

The 2019 Building Energy Efficiency Standards improve upon the 2016 Energy Standards for new construction of, and additions and alterations to, residential and nonresidential buildings. Buildings permitted on or after January 1, 2020, must comply with the 2019 Standards. The California Energy Commission updates the standards every three years.

Online Resource Center

Educational documents and training information for building communities and enforcement agencies to assist with building energy standards compliance.

LEARN MORE
The Home Energy Rating System (HERS) Program tests and rates the energy performance of a home. The California Energy Commission's HERS Program addresses construction defects and poor equipment installation, including HVAC systems and insulation. The Energy Commission has a list of approved HERS providers who train and certify raters.
Acceptance Test Technician Certification Provider Program - ATTCP

Acceptance Test Technicians perform required tests for lighting controls and mechanical systems in nonresidential buildings. The California Energy Commission’s approved Acceptance Test Technician Certification Providers (ATTCP) train, certify, and oversee the technicians and their employers.
