2022 Energy Code Basics

WARREN-ALQUIST ACT

Warren-Alquist State Energy Resources Conservation and Development Act

Public **Resources** Code Section 25000 et seq.

CALIFORNIA ENERGY COMMISSION Gavin Newsom, Governor

2022 EDITION JANUARY 2022 CEC-140-2022-001

Warren-Alquist Act established CEC in 1974

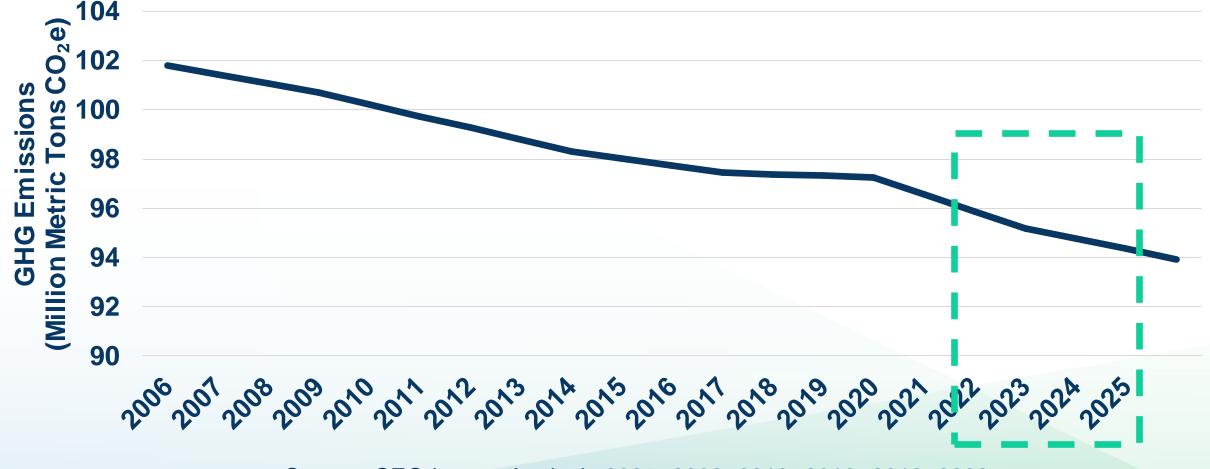

- Authority to develop and maintain Building Energy Efficiency Standards (Energy Code)
- Requires CEC to update periodically, usually every 3 years
- Requires Energy Code to be cost-effective over economic life of building

- Increase building energy efficiency cost-effectively
- Contribute to California's greenhouse gas (GHG) reduction goals
- Enable pathways for all-electric buildings
- Reduce residential building impacts on the electricity grid
- Promote demand flexibility and self-utilization of photovoltaic (PV)
- Provide tools for local government reach codes

Reduced Statewide Emissions

Source: CEC Impact Analysis 2005, 2008, 2013, 2016, 2019, 2022

Effective January 1, 2023

- Building permit applications submitted on or after Jan 1, 2023
- Must use 2022 tools

 Software
 Forms

2022 Building Energy Efficiency Standards

The Building Energy Efficiency Standards (Energy Code) apply to newly constructed buildings, additions, and alterations. They are a vital pillar of California's climate action plan. The 2022 Energy Code will produce benefits to support the state's public health, climate, and clean energy goals.

The California Energy Commission (CEC) updates the Energy Code every three years. On August 11, 2021, the CEC adopted the 2022 Energy Code. In December, it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Energy Code encourages efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, strengthens ventilation standards, and more. Buildings whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code.

2022 Energy Code Highlights

- Heat pump baselines
- Solar and battery storage
- Ventilation requirements
- Lighting
- Multifamily restructuring

Mandatory requirements

- Minimum efficiency requirements must always be met
- Can <u>never</u> trade off

Prescriptive requirements

- Predefined efficiency requirements
- May supersede mandatory requirements
- Different requirements for newly constructed buildings, additions, and alterations

Compliance Approaches

Prescriptive approach

- Simple approach, no trade-offs
- Defines the standard building design
- 2022 heat pump baselines

Performance approach

- Most flexible approach, allows for trade-offs
- Must meet all mandatory requirements
- Requires the use of CEC-approved software
- Proposed building design meets or exceed standard building design

Source energy performance calculations

- Nonresidential and multifamily
 - \circ Hourly source energy
 - TDV Efficiency
 - TDV Total
 - Efficiency, PV + battery

New for 2022

Demonstrating Compliance

- Compliance forms confirm Energy Code is met
- Completed by responsible party
 - Designers, consultants, builders, contractors, technicians, HERS raters, etc.
- Submitted to enforcement agencies for verification

Type of form	Single-family	Multifamily 3 or less habitable stories	Nonresidential Multifamily 4 or more habitable stories
Certificate of compliance	CF1R	LMCC	NRCC
Certificate of installation	CF2R	LMCI	NRCI
Certificate of verification	CF3R	LMCV	NRCV
Certificate of acceptance	-	-	NRCA

Updated for 2022

All Buildings § 10-103

Updated for 2022

Multifamily buildings 3 or fewer habitable stories

 When HERS verification is required all LMCC, LMCI, and LMCV forms must be registered with HERS provider data registry

Multifamily buildings 4 or more habitable stories

 NRCV must be registered with HERS provider when required
 When lighting or mechanical acceptance test is required all NRCC, NRCI, and NRCA forms must be recorded with ATTCP

Performance approach must use <u>approved compliance</u> <u>software versions</u>

Nonresidential and multifamily

 CBECC 2022.3.0
 EnergyPro 9.2
 IES 2.0

Mandatory Requirements

130.3(a) Sign Lighting Controls

Sign lighting control requirements apply to nonresidential and hotel/motel buildings; do not apply to healthcare facilities.

1. Indoor signs (except for exit signs) must be controlled by an automatic time-switch control or an astronomical time-switch control.

2. Outdoor signs:

- A. Must be controlled with Automatic time-switch and photosensor, or astronomical time-switch control. Exceptions for tunnels and permanently covered outdoor areas that are lit 24 hours per day, 365 days per year.
- B. Signs on at night and more than 1 hour during day must have dimmer that can automatically reduce power by ≥ 65% at night. Exceptions for tunnels and large covered areas illuminated both day and night.

130.3(a)3, 110.12 Demand Responsive Electronic Message Center Control

Controls for an **Electronic Message Center** (EMC) with load > 15 kW must:

- Be capable of automatically reducing lighting power by a minimum of 30% in response to a demand response signal; and
- Be a certified OpenADR 2.0a or 2.0b Virtual End Node (VEN) or certified as being capable of responding to OpenADR 2.0b VEN.
 - More information is available at the CEC's <u>Demand Responsive</u> <u>Lighting Control</u> webpage
- Exception: EMCs not permitted by health or life safety statute, ordinance, or regulation to be reduced.

Prescriptive Requirements

Compliance with sign lighting power will be based on wattage allowance or usage of specific light source types:

- **o Maximum Allowed Lighting Power (wattage allowance)**
 - Internally illuminated signs: 12 watts/square foot
 - Externally illuminated signs: 2.3 watts/square foot
- **o Alternate Lighting Sources**
 - Automatically complies if specific light sources are used
 - Unfiltered LEDs and neon must comply with alternate lighting sources method

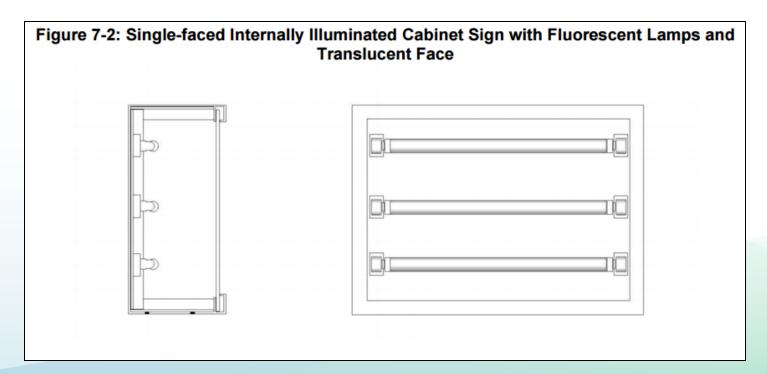

• Exceptions

- **Unfiltered incandescent lamps** that are not part of an electronic message center (EMC), an internally illuminated sign, or an externally illuminated sign.
- Exit signs shall meet the requirements of the Appliance Efficiency Regulations.
- **Traffic signs** shall meet the requirements of the Appliance Efficiency Regulations.

Internally illuminated signs

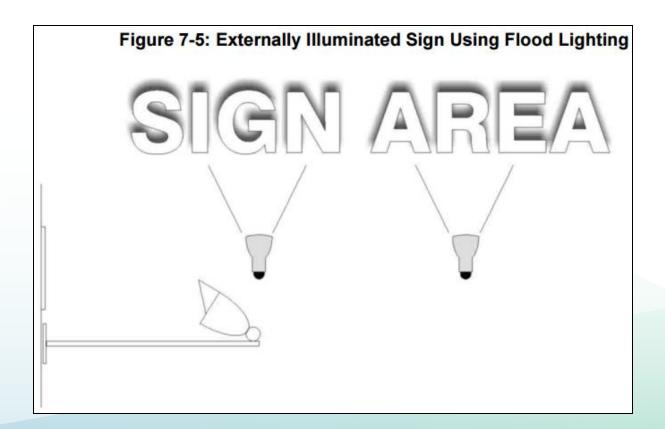

- \odot Allowed lighting power is the product of the illuminated face area and 12 watts/ft^2
- \circ Double-faced signs use only the area of a single face

Externally illuminated signs

 \odot Allowed lighting power is the product of the illuminated face area and 2.3 watts/ft^2

Light sources will comply if meeting specific efficiency requirements:

- \odot High pressure sodium
- Metal halide (MH)
 - Pulse start or ceramic MH with ballast efficiency \geq 88%; or
 - Pulse start MH ≤ 320 watt with ballast efficiency ≥ 80% (Not including 175 watt or 250-watt MH lamps)
- \odot Neon or cold cathode
 - Rated output current < 50 mA: power supply/transformer efficiency ≥ 75%; or
 - Rated output current ≥ 50 mA: power supply/transformer efficiency ≥ 68%

Light sources will comply if meeting specific efficiency requirements:

- **o Fluorescent lighting**
 - Use only lamps with $CRI \ge 80$; or
 - Use electronic ballasts with output frequency \geq 20 kHz

 \circ LED

- Power supply efficiency $\geq 80\%$
- **Compact Fluorescent**
 - Cannot contain medium screw base socket (E24/E26)

Additions and Alterations

Sign lighting alterations must meet power requirements of 140.8 when:

- \circ Increasing connected lighting load; or
- \circ Replace and rewire > 50% of ballasts; or
- Relocate sign to a different location on the same site or on a different site

Note

Replacing ballasts or lamps alone does not trigger requirements
 There are no control requirements for sign lighting alterations
 New signs must meet power and control requirements
